

Question-8.2.1

EE24BTECH11038 - MALAKALA BALA SUBRAHMANYA ARAVIND

Question: Find the area of the circle $4x^2 + 4y^2 = 9$, which is interior to the parabola $x^2 = 4y$

Solution:

Trapezoidal rule: It is a numerical method for approximating the definite integral of a function. The classic definition is as follows:

Given a function $f(x)$ that is continuous in the interval $[a, b]$, the trapezoidal rule approximates the integral by dividing the interval $[a, b]$ into n sub intervals of equal width $h = \frac{b-a}{n}$. The x -values at the sub interval boundaries are:

$$x_0 = a, x_1 = a + h, x_2 = a + 2h, \dots, x_n = b. \quad (0.1)$$

The trapezoidal rule then computes the integral as

$$\int_a^b f(x) dx \approx \frac{h}{2} (f(x_0) + 2f(x_1) + 2f(x_2) + \dots + 2f(x_{n-1}) + f(x_n)) \quad (0.2)$$

First we need to calculate the point of intersections of the two given curves

$$y = \frac{x^2}{4} \quad (0.3)$$

$$x^2 + y^2 = \frac{9}{4} \quad (0.4)$$

$$x^2 + \frac{x^4}{16} = \frac{9}{4} \quad (0.5)$$

$$16x^2 + x^4 = 36 \quad (0.6)$$

on solving the equation we get x values as $\sqrt{2}$ and $-\sqrt{2}$

so the points of intersection of both curves are $(\pm\sqrt{2}, \frac{1}{2})$

The interval $[-\sqrt{2}, \sqrt{2}]$ is divided into 1000 sub intervals each of width $h = \frac{2\sqrt{2}}{1000}$ then the points in the interval can be written as

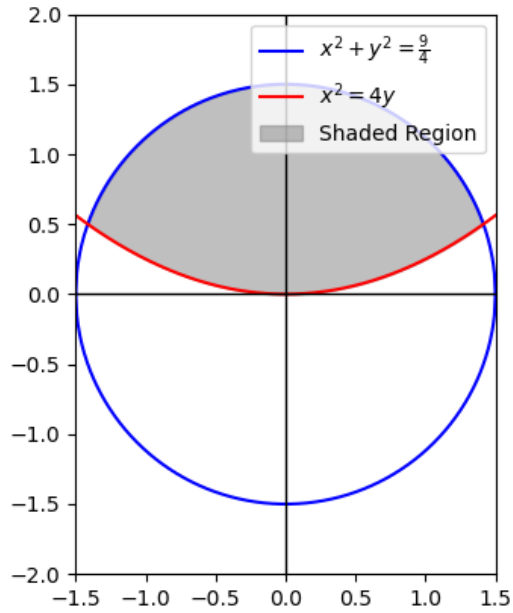

$$x_i = -\sqrt{2} + i \cdot h \quad (0.7)$$

$$\text{Area} \approx \frac{h}{2} \left[f(x_0) + 2 \sum_{i=1}^{n-1} f(x_i) + f(x_n) \right] \quad (0.8)$$

$$f(x_i) = \sqrt{\frac{9}{4} - x_i^2} - \frac{x_i^2}{4} \quad (0.9)$$

Using a c code to find the area using trapezoidal rule i got the area as

$$A \approx 3.005356 \quad (0.10)$$

If the area is calculated directly using integration method the area would be around 3.063 which is so close to the one we found using trapezoidal rule
